Quik-Irr™

Powerful software for irrigation professionals

Quick-Irr™ Software can help you to:

- **Know your costs**

- **Be more productive**

- **Instantly access product information**

Suppliers provide a product database that is easily loaded into the program. They also provide product data files for items in their inventory on a reference CD.

Use Quik-Irr to:
- Build a material list complete with pricing
- Generate reports
- Easily open Product Information Data Files
- Send orders via Internet, e-mail, fax, or printed hard copy
- Export the material list for use in other programs

Search the database

Database search tools are key for ease of use. There are nine ways to locate items for building a material list.

- **Irrigation Wizard** — Over 6,000 items are included in the Wizard. As products are selected together with assemblies, the Wizard searches the database automatically.

- **Search Tree** — Follow branches on the Search Tree that lead to products supplied by the distributor.

- **Templates** — Create templates containing commonly used items for a type of job or custom assemblies. Quickly insert a template in a material list.

- **Product Categories** — A category search will display all items grouped in the category.

- **Product Code** — Each item can have up to six product codes. Search for items by:

    Exact product code

    Beginning characters of the product

    Characters used in the product code

- **Description** — An item can have both a primary and secondary description. Search the descriptions by key characters.

- **Combined Search** — A product code or description search may be combined with a category search to narrow the search results.

Quik-Irr Software is the fastest, most accurate way to build a complete material list for an irrigation system.
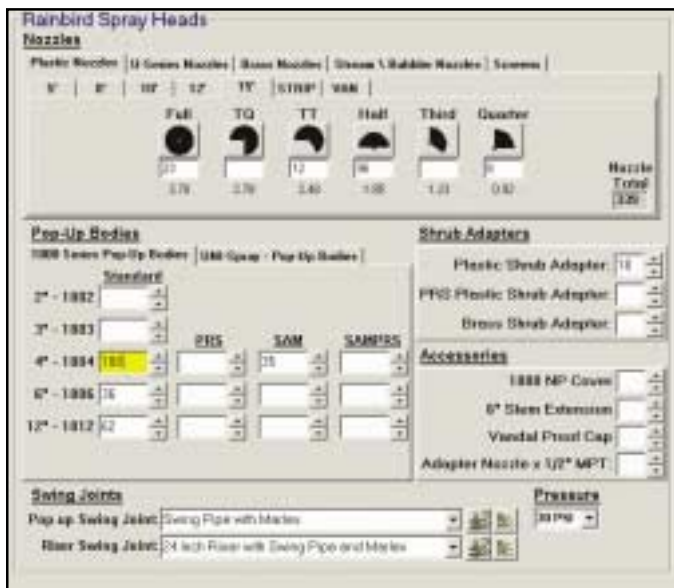

Irrisoft™

Build a material list to price out a job

- Use the search tools to locate the items and then use drag and drop to quickly add items to a project material list
- Enter items by product code
- Customer net price is included with the database
- Group products with header text
- Add comment text if needed
- Totals are extended
- Subtotals can be added
- Calculate the sell price based on list price or customer net price

The Power of Quik-Irr is in the Wizard

Use the Wizard to quickly build a complete and accurate material list for an irrigation system. The irrigation Wizard contains a series of screens to prompt the user to make choices based on the needs of each irrigation project. These screens include products from many major irrigation manufacturers including:

- 3M
- Action Machine
- Amiad
- Carson Industries
- Harco
- Hunter
- IPS
- King Safety

- Netafim
- Paige
- Rain Bird
- Strong Box
- Toro
- Watts
- Weathermatic
- Wilkins

A Wizard screen makes it easy to choose the needed parts.

Each screen displays products by size and available options. There are over 100 screens used to access over 6,000 items, but you can customize the Wizard to only use the screens needed for each type of job. There are screens containing details about:

- sprinkler heads
- drip irrigation
- automatic valves
- controller accessories
- pipe
- fittings
- manifolds
- wire

- backflow prevention
- filters
- valve boxes
- copper/brass fittings
- sleeves
- isolation valves
- irrigation controllers
- drains

The Wizard will guide the estimator through the take-off of an existing irrigation design. Or if a quick estimate is needed, there are many calculators that can help estimate the number of heads, valves, and controllers.

- Head quantities can be estimated based on the square footage of the area to be irrigated.
- Valves can be estimated because the Wizard keeps track of the total system GPM based on selected heads.
- Pipe can be estimated and sized based on head spacing and GPM.
- Fittings can be estimated based on the number and type of head, combined with the pipe quantity and number of valves.

Many items are associated with assemblies, for example a sprinkler head may need a swing joint. Assemblies may be selected from many predefined templates, but custom templates may also be created.

Export — The price list may be exported for use in other programs such as Microsoft® Excel.

Purchasing — Quickly generate a complete purchase order off-line without having to wait for the Internet. Then send the order to the supplier. Quik-Irr can send orders via Internet, e-mail, fax, or printed hard copy.

Product Information Files — A distributor can provide manufacturers' product specifications or detailed information in a CD library that can be read using the Adobe Acrobat Reader®, a Web browser, or some other file viewer. The files in the library are linked to products in the database. When an item has a product information file link, a single mouse click will open the file.
